Divide and Conquer “Divide and Conquer”

- A D&C algorithm can be split into the following steps:

Divide and Conquer “Divide and Conquer”

- A D&C algorithm can be split into the following steps:
 - *Divide* input into “smaller”¹ inputs;

¹this is a Chekov's gun

Divide and Conquer “Divide and Conquer”

- A D&C algorithm can be split into the following steps:
 - *Divide* input into “smaller”¹ inputs;
 - Recursively apply the algorithm to them;

¹this is a Chekov's gun

Divide and Conquer “Divide and Conquer”

- A D&C algorithm can be split into the following steps:
 - *Divide* input into “smaller”¹ inputs;
 - Recursively apply the algorithm to them;
 - *Combine* to compute the result.

¹this is a Chekov's gun

Case Studies: Quick- and Mergesort

- Algorithms can differ in which step does the “heavy lifting”

Case Studies: Quick- and Mergesort

- Algorithms can differ in which step does the “heavy lifting”
- Quicksort: Main logic in the *divide* step: partition elements around the pivot. Combine step: concatenation.

Case Studies: Quick- and Mergesort

- Algorithms can differ in which step does the “heavy lifting”
- Quicksort: Main logic in the *divide* step: partition elements around the pivot. Combine step: concatenation.
- Mergesort: Business end is the *combine* step: zipping two ordered lists into one. Divide step: Splitting the list in half.

D&CAs as Coalgebra-to-Algebra Morphisms

$$\begin{array}{ccc} FI & \xrightarrow{Fh} & FO \\ \uparrow c & & \downarrow a \\ I & \xrightarrow{\quad h \quad} & O \end{array}$$

D&CAs as Coalgebra-to-Algebra Morphisms

$$\begin{array}{ccc}
 FI & \xrightarrow{Fh} & FO \\
 c \uparrow & & \downarrow a \\
 I & \dashrightarrow h & O
 \end{array}$$

- *Coalgebra* c : Divide input up into smaller inputs, the distribution of which is given by a functor F ;

D&CAs as Coalgebra-to-Algebra Morphisms

$$\begin{array}{ccc}
 FI & \xrightarrow{Fh} & FO \\
 c \uparrow & & \downarrow a \\
 I & \dashrightarrow h & O
 \end{array}$$

- *Coalgebra* c : Divide input up into smaller inputs, the distribution of which is given by a functor F ;
- Fh : Apply h recursively under F ;

D&CAs as Coalgebra-to-Algebra Morphisms

$$\begin{array}{ccc}
 FI & \xrightarrow{Fh} & FO \\
 \uparrow c & & \downarrow a \\
 I & \xrightarrow{\quad h \quad} & O
 \end{array}$$

- *Coalgebra* c : Divide input up into smaller inputs, the distribution of which is given by a functor F ;
- Fh : Apply h recursively under F ;
- *Algebra* a : Combine an F -structure of the results of recursive calls to obtain the output.

D&CAs as Coalgebra-to-Algebra Morphisms

$$\begin{array}{ccc}
 FI & \xrightarrow{Fh} & FO \\
 c \uparrow & & \downarrow a \\
 I & \dashrightarrow h & O
 \end{array}$$

- A coalgebra c is called *recursive* if, for every algebra a , it admits a unique solution to the equation²

$$h = c; Fh; a$$

²sometimes called the “hylo” or *hylomorphism* equation

D&CAs as Coalgebra-to-Algebra Morphisms

$$\begin{array}{ccc}

Narrowing our focus

- As mentioned, the *interesting* step of quicksort is the *divide* step, i.e. partitioning a list around a pivot.

Narrowing our focus

- As mentioned, the *interesting* step of quicksort is the *divide* step, i.e. partitioning a list around a pivot.
- We therefore focus on that step from now.

Narrowing our focus

- As mentioned, the *interesting* step of quicksort is the *divide* step, i.e. partitioning a list around a pivot.
- We therefore focus on that step from now.
- partition: $\text{List}A \rightarrow 1 + \text{List}A \times A \times \text{List}A \dots$

Narrowing our focus

- As mentioned, the *interesting* step of quicksort is the *divide* step, i.e. partitioning a list around a pivot.
- We therefore focus on that step from now.
- partition: $\text{List}A \rightarrow 1 + \text{List}A \times A \times \text{List}A \dots$
- $\dots \Rightarrow$ Functor F is: $F X = 1 + X \times A \times X$

Example: Growing a BST with partition

2 : 5 : 4 : 1 : 3 : []

partition: ListA \rightarrow
 $\circ + \text{ListA} \times A \times \text{ListA}$

Example: Growing a BST with partition

partition: ListA \rightarrow
 $\circ + \text{ListA} \times A \times \text{ListA}$

Example: Growing a BST with partition

partition: ListA \rightarrow
 $\bigcirc + \text{ListA} \times A \times \text{ListA}$

Example: Growing a BST with partition

partition: ListA \rightarrow
 $\bigcirc + \text{ListA} \times A \times \text{ListA}$

Example: Growing a BST with partition

partition: ListA \rightarrow
 $\bigcirc + \text{ListA} \times A \times \text{ListA}$

Partial Correctness of Quicksort

- **Orderedness:** The elements to the left/right of the pivot in the $\text{List } A \times (p : A) \times \text{List } A$ case are smaller/greater than p
- **Element-preservation:** $\text{partition}(xs)$ and xs have the same multiset of elements.
- Working in the setting of data with mappings to the multiset $(\mathcal{B}A)$ of their elements allows us to express both these properties!
- We focus on the element-preservation property here, as that is relevant for termination.

Sliced Partition

- Redefine partition in the slice category $\text{Set}/\mathcal{B}A$
- We can define lift F to \bar{F} as:

$$\bar{F} \left(\begin{array}{c} X \\ f \end{array} \right) := \left(\begin{array}{c} 1 \\ \emptyset \end{array} \right) + \left(\begin{array}{c} \{(l, p, r) \in X \times A \times X\} \\ f(l) \uplus \{p\} \uplus f(r) \end{array} \right)$$

- Note: The multiset indices of the recursive positions are smaller than the outer index: $|f(l)|, |f(r)| < |f(l) \uplus \{p\} \uplus f(r)|$.

- 4 Application to QuickSort
- 5 Current & Future Work
- 6 Conclusion

Formalizing “the indices of the recursive positions are smaller than the outer index”

Notation

Fix a well order $(W, <)$. For $i \in W$, we denote by $<i := \{j \in W \mid j < i\}$ the set of indices strictly smaller than i (the *downset* of i). We have two projection functors, *restriction* and *evaluation*:

$$\begin{array}{ll}
 -|_{<i} : \mathcal{C}^W \rightarrow \mathcal{C}^{<i} & \text{ev}_i : \mathcal{C}^W \rightarrow \mathcal{C} \\
 X|_{<i} := (X_j)_{j \in <i} & \text{ev}_i X := X_i
 \end{array}$$

Introducing: Well Founded Functors

- Intuition: “The i th output of the functor $F: \mathcal{C}^W \rightarrow \mathcal{C}^W$ is fully determined by its inputs with indices $j < i$.”

Introducing: Well Founded Functors

- Intuition: “The i th output of the functor $F: \mathcal{C}^W \rightarrow \mathcal{C}^W$ is fully determined by its inputs with indices $j < i$.”
- “ $F: \mathcal{C}^{j \in I} \rightarrow \mathcal{C}^{i \in I}$ is morally equivalent to a family $(F_{<i}: \mathcal{C}^{j < i} \rightarrow \mathcal{C})_{i \in I}$ ”

Introducing: Well Founded Functors

Definition (Well-Founded Functor)

A functor $F: \mathcal{C}^W \rightarrow \mathcal{C}^W$ is *well-founded* if for every $i \in I$, the composition $\text{ev}_i \cdot F: \mathcal{C}^W \rightarrow \mathcal{C}$ factors through the restriction $|_{<i}: \mathcal{C}^W \rightarrow \mathcal{C}^{<i}$, that is, there exists a functor $F_{<i}$ such that the diagram below commutes up to natural isomorphism:

$$\forall i \in I: \quad \begin{array}{ccc} \mathcal{C}^W & \xrightarrow{F} & \mathcal{C}^W \\ \downarrow |_{<i} & \cong & \downarrow \text{ev}_i \\ \mathcal{C}^{<i} & \xrightarrow{\exists F_{<i}} & \mathcal{C} \end{array}$$

Proving WFness of a functor

$$\begin{array}{ccc}
 \mathcal{C}^I & \xrightarrow{F} & \mathcal{C}^I \\
 \downarrow \text{ev}_i & \cong & \downarrow \text{ev}_i \\
 \mathcal{C}^{<i} & \xrightarrow{F_{<i}} & \mathcal{C}
 \end{array}$$

Proving WFness of a functor

$$\begin{array}{ccc}
 \mathcal{C}^I & \xrightarrow{F} & \mathcal{C}^I \\
 \downarrow \text{ev}_i & \cong & \downarrow \text{ev}_i \\
 \mathcal{C}^{<i} & \xrightarrow{F_{<i}} & \mathcal{C}
 \end{array}$$

- We define a canonical way to turn any functor F into a family $F_{<i} : (\mathcal{C}^{<i} \rightarrow \mathcal{C})_{i \in I}$, for which we obtain a projection $\varepsilon_F X i : F_{<i}(X|_{<i})i \rightarrow F X i$.

Proving WFness of a functor

$$\begin{array}{ccc}
 \mathcal{C}^I & \xrightarrow{F} & \mathcal{C}^I \\
 \downarrow \text{!}_{<i} & \cong & \downarrow \text{ev}_i \\
 \mathcal{C}^{<i} & \xrightarrow{F_{<i}} & \mathcal{C}
 \end{array}$$

- We define a canonical way to turn any functor F into a family $F_{<i} : (\mathcal{C}^{<i} \rightarrow \mathcal{C})_{i \in I}$, for which we obtain a projection $\varepsilon_F X i : F_{<i}(X|_{<i})i \rightarrow F X i$.
- Client code of the library then consists of defining an inclusion $\varepsilon_F^{-1} X i : F X i \rightarrow F_{<i}(X|_{<i})i$ which is an inverse to this.

Proving WFness of a functor

$$\begin{array}{ccc}
 \mathcal{C}^I & \xrightarrow{F} & \mathcal{C}^I \\
 \downarrow \text{!}_{<i} & \cong & \downarrow \text{ev}_i \\
 \mathcal{C}^{<i} & \xrightarrow{F^{<i}} & \mathcal{C}
 \end{array}$$

- We define a canonical way to turn any functor F into a family $F_{<i} : (\mathcal{C}^{<i} \rightarrow \mathcal{C})_{i \in I}$, for which we obtain a projection $\varepsilon_{F^1} X i : F_{<i}(X|_{<i})i \rightarrow F X i$.
- Client code of the library then consists of defining an inclusion $\varepsilon_{F^1}^{-1} X i : F X i \rightarrow F_{<i}(X|_{<i})i$ which is an inverse to this.
- Next: How we use these parts to solve our original goal of proving recursivity for coalgebras for F

Diagrammatically

$$\begin{array}{ccc}
 (F_{<i}C \mid_{<i})_i & \xrightarrow{(F_{<i}h \mid_{<i})_i} & (F_{<i}D \mid_{<i})_i \\
 \varepsilon_i^{-1} \uparrow & \circlearrowleft & \downarrow \varepsilon_i \\
 FC_i & \xrightarrow{Fh_i} & FD_i \\
 c_i \uparrow & & \downarrow a_i \\
 C_i & \xrightarrow{h_i} & D_i
 \end{array}$$

$\forall i \in I:$

Diagrammatically

$$\begin{array}{ccc}
 (F_{<i}C \mid_{<i})_i & \xrightarrow{(F_{<i}h \mid_{<i})_i} & (F_{<i}D \mid_{<i})_i \\
 \varepsilon_i^{-1} \uparrow & \circlearrowleft & \downarrow \varepsilon_i \\
 FC_i & \xrightarrow{Fh_i} & FD_i \\
 c_i \uparrow & & \downarrow a_i \\
 C_i & \xrightarrow{h_i} & D_i
 \end{array}$$

$\forall i \in I:$

- To define h_i , we need only $h \mid_{<i} \dots$

Diagrammatically

$$\begin{array}{ccc}
 (F_{<i}C \mid_{<i})_i & \xrightarrow{(F_{<i}h \mid_{<i})_i} & (F_{<i}D \mid_{<i})_i \\
 \varepsilon_i^{-1} \uparrow & \circlearrowleft & \downarrow \varepsilon_i \\
 FC_i & \xrightarrow{Fh_i} & FD_i \\
 c_i \uparrow & & \downarrow a_i \\
 C_i & \xrightarrow{h_i} & D_i
 \end{array}$$

$\forall i \in I:$

- To define h_i , we need only $h \mid_{<i} \dots$
- We can define $(h_i)_{i \in I}$ by well founded induction!

Diagrammatically

$$\begin{array}{ccc}
 (F_{<i}C \mid_{<i})_i & \xrightarrow{(F_{<i}h \mid_{<i})_i} & (F_{<i}D \mid_{<i})_i \\
 \varepsilon_i^{-1} \uparrow & \circlearrowleft & \downarrow \varepsilon_i \\
 FC_i & \xrightarrow{Fh_i} & FD_i \\
 c_i \uparrow & & \downarrow a_i \\
 C_i & \xrightarrow{h_i} & D_i
 \end{array}$$

$\forall i \in I:$

- To define h_i , we need only $h \mid_{<i} \dots$
- We can define $(h_i)_{i \in I}$ by well founded induction!
- Next: How we define $F_{<i}$

Wellfoundedification

$$\begin{array}{ccc}
 \mathcal{C}^W & \xrightarrow{F} & \mathcal{C}^W \\
 \downarrow \text{!}_{<i} & \begin{array}{c} \parallel \\ \text{!} \\ \text{F}_{<i} \end{array} & \downarrow \text{ev}_i \\
 \mathcal{C}^{<i} & \xrightarrow{\text{---}} & \mathcal{C} \\
 \downarrow J_{<i} & & \text{ev}_i \uparrow \\
 \mathcal{C}^W & \xrightarrow{F} & \mathcal{C}^W
 \end{array}$$

Definition (Inclusion Functor $J_{<}$)

$$(J_{<i}X)_j: \mathcal{C}^{<i} \rightarrow \mathcal{C}^W$$

$$(J_{<i}X)_j := \begin{cases} X_j & \text{if } j < i, \\ 0 & \text{otherwise} \end{cases}$$

Wellfoundedification

$$\begin{array}{ccc}
 \mathcal{C}^W & \xrightarrow{F} & \mathcal{C}^W \\
 \downarrow |\cdot|_{<i} & \begin{array}{c} \parallel \\ \text{!} \\ \text{F}_{<i} \end{array} & \downarrow \text{ev}_i \\
 \mathcal{C}^{<i} & \xrightarrow{\text{---}} & \mathcal{C} \\
 \downarrow J_{<i} & & \uparrow \text{ev}_i \\
 \mathcal{C}^W & \xrightarrow{F} & \mathcal{C}^W
 \end{array}$$

Definition (Inclusion Functor $J_{<i}$)

$$(J_{<i}X)_j: \mathcal{C}^{<i} \rightarrow \mathcal{C}^W$$

$$(J_{<i}X)_j := \begin{cases} X_j & \text{if } j < i, \\ 0 & \text{otherwise} \end{cases}$$

- N.B.: Need decidability of $<?$ to define $J_{<i}$. Then, to prove inhabitation of $(J_{<i}X)_j$, one need prove $j <? i$ evaluate to \top .
- We avoid this by specializing \mathcal{C} to Set , and using *copartial elements*:

$$(J_{<i}X)_j: \text{Set}^{<i} \rightarrow \text{Set}^W \quad (J_{<i}X)_j := \{x \mid j < i, x \in X_j\}$$

Mechanization

$< : A \rightarrow \text{Type} \text{ -- downset}$

$< i = \Sigma [j \in A] (j < i)$

-- restriction

$_ | < _ : (A \rightarrow \text{Type}) \rightarrow (i : A) \rightarrow ((< i) \rightarrow \text{Type})$

$(X | < i) (j, _pf) = X j$

$\text{-- inclusion: copartial element formulation}$

$J < : (i : A) \rightarrow ((< i) \rightarrow \text{Type}) \rightarrow (A \rightarrow \text{Type})$

$J < i X j = \Sigma [pf \in j < i] X (j, pf)$

$\text{-- truncation: restriction, then inclusion: } _ | < ; J < \approx T$

$T : (i : A) \rightarrow (A \rightarrow \text{Type}) \rightarrow (A \rightarrow \text{Type})$

$T i X j = (j < i) \times X j \text{ -- "annotate with pfs } j < i"$

$$\begin{array}{ccccc}
 \mathcal{C}^W & \xrightarrow{-|<i} & \mathcal{C}^{<i} & \xrightarrow{J_{<i}} & \mathcal{C}^W \\
 \downarrow F & & \cong & \downarrow F_{<i} & \downarrow F \\
 \mathcal{C}^W & \xrightarrow{\text{ev}_i} & \mathcal{C} & \xleftarrow{\text{ev}_i} & \mathcal{C}^W
 \end{array}$$

- 2 Example: QuickSort
- 3 WDYM *recursive positions?* WDYM *smaller?*
- 4 Application to QuickSort
- 5 Current & Future Work**
- 6 Conclusion

Inclusion-restriction adjunction

For our original $(J_{<i}X)_j: \mathcal{C}^{<i} \rightarrow \mathcal{C}^W$ we have:

$$\mathcal{C}^{<i} \begin{array}{c} \xrightarrow{J_{<i}} \\ \perp \\ \xleftarrow{-\lrcorner_{<i}} \end{array} \mathcal{C}^W$$

However, for $J_{<}$, only the counit can be defined. It turns out that our formalization dualizes to a *partial element* formulation.

$$J_{<} J'_{<} : (i : A) \rightarrow ((<i) \rightarrow \mathbf{Type}) \rightarrow (A \rightarrow \mathbf{Type})$$

$$J'_{<} i X j = \forall (pf : j < i) \rightarrow X(j, pf)$$

$$J_{<} i X j = \Sigma[pf \in j < i] X(j, pf)$$

Dually for $J'_{<}$ only the unit can be defined. Intuition: partial element defer checking totality to *elimination*; copartial elements must be shown total at introduction.

Future Work

- Explore the (co)partial element connection further to un-specialize from Set
- Develop a variant of our technique for an entirely non-indexed (extrinsic) setting
